

Success Story

Global Omnium

How Global Omnium achieved an accessible website and virtual office, easily, in just four weeks

What they needed

Global Omnium had a **web platform that was shared by all its licensees** (more than 20 web portals). This included a **virtual office**, which was used for transactions such as billing and viewing water use, updating details, setting up and closing accounts, etc.

They needed to make this web platform and the virtual office as **accessible as possible for all citizens**.

In addition, it was essential for them to ensure accessibility for its **password-protected virtual office**.

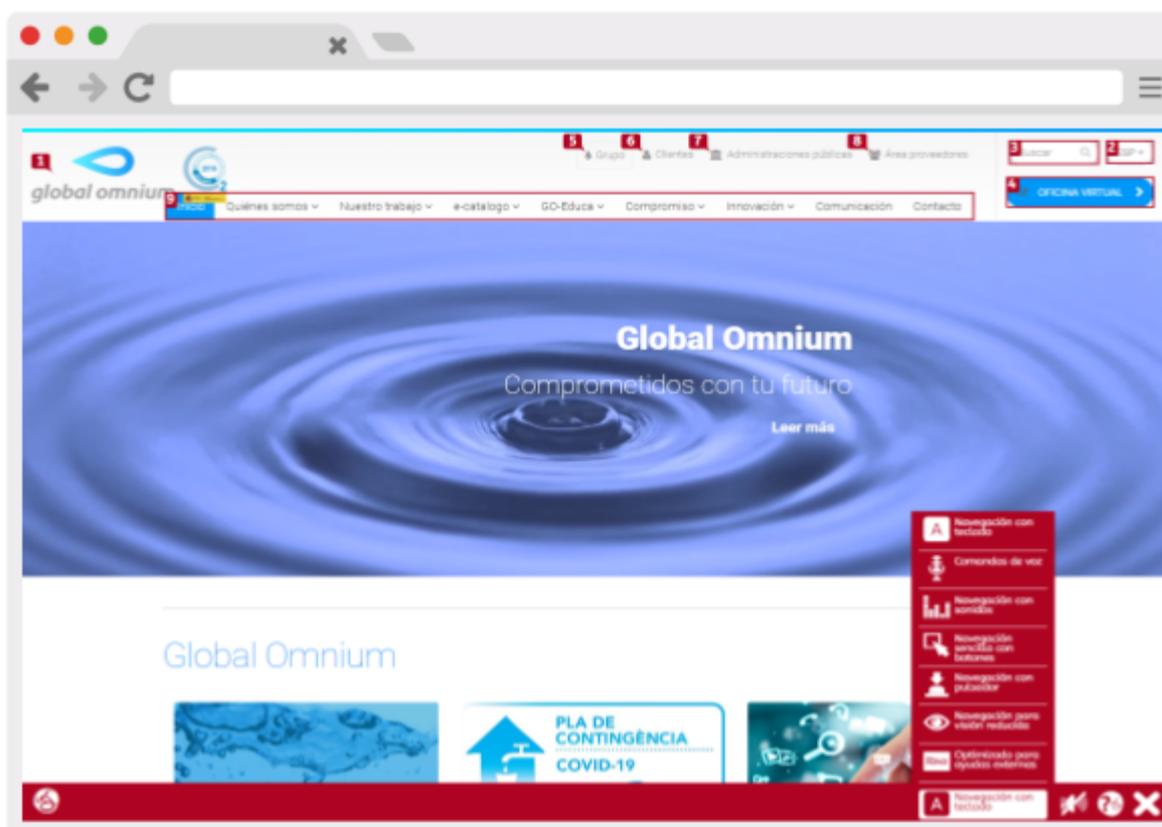

Salient characteristics of the Global Omnium web platform (main domain):

Content management:	Monthly accessible visits:	JavaScript Libraries:
Own	3,000 +	jQuery, GSAP

How this was solved by inSuit

inSuit was implemented for Global Omnium **as a SaaS** and the implementation team, made up of web accessibility experts, **generated and customised the rules** they needed to ensure the optimum operation of the inSuit platform on the Global Omnium web portal.

Implementation lasted four weeks, and all the portals were deployed quickly by just **including a customised activation script** on each web portal.

The result

Today, thousands of people use inSuit to access Global Omnium's web portals every month, in a manner that is fully adapted to their needs.

They have seen how **inSuit performs well** in conjunction with the **virtual office**, a great advantage for users with disabilities who need to carry out a number of transactions online without having to leave their homes.
